New aqueous electrolyte

January 7, 2023

In news– Scientists from Institute of Nano Science and Technology (INST) Mohali, an autonomous institute of Department of Science and Technology (DST), have introduced a new electrolyte called (NaBF4) recently.

About new electrolyte-

- **A new aqueous electrolyte can help make electrochemical ammonia synthesis more efficient** will be **useful for industries producing green energy or hydrogen.**
- The electrochemical ammonia synthesis is largely limited by the poor solubility of nitrogen (N2) in the aqueous electrolyte environment as well as the competitive hydrogen evolution reaction.
- **The obstacle faced was that reduction of N2 has actually occurred in the aqueous medium**. In an attempt to solve these issues, the "ambient" conditions are mostly overseen.
- Researchers mostly work on catalyst development, while electrolyte improvisation still remains in infancy.
- According to a recent report, 90.7 % of the research works related to : Nitrogen reduction reaction (NRR) have focused on the suitable catalyst development, while only 4.7 % have been devoted to work on the electrolytes.
- Scientists from INST Mohali have introduced a **new electrolyte called (NaBF4), which not only acts as an N2-carrier in the medium** but **also works as a full-fledged "co-catalyst"** along with active material transition metal-doped nanocarbon (MnN4) to deliver high yield of ammonia (NH3) at absolutely ambient experimental conditions.
- The high production rate of NH3 approached industrial scale and exceeded almost all the standard catalysts in

any other electrolyte medium.

- The source of NH_3 was thoroughly studied and confirmed to be chiefly from the electrochemical reduction of the purged N_2 gas (make it N_2 saturated electrolyte to convert N_2 to NH_3).
- **This research is a novel approach to get through the long-standing issues about the solubility of N_2 in aqueous medium** and achieve industrial scale production rate of ammonia by NRR at ambient condition.
