

Sociable Lapwing

April 7, 2021

About sociable lapwing

- The sociable lapwing or sociable plover (*Vanellus gregarius*) is a critically endangered wader in the lapwing family of birds.
- Critically endangered – IUCN
- This medium-sized lapwing has longish black legs and a short black bill.
- Summer adults have grey backs and breast, dark belly and white undertail.
- The head has a striking pattern, with a black crown and eyestripe, the latter being bordered above and below with white.
- Its longish black legs, white tail with a black terminal band and distinctive brown, white and grey wings make it almost unmistakable in flight. Length is 27–30 cm (11–12 in).
- The current IUCN classification is CR A3bc—meaning that the population is expected to decline in the next decade or so by 80%.
