

Sulfur Dioxide Emission Norms delayed

February 22, 2021

In News

- The Supreme Court rejected the request of Association of Power Producers (APP) to extend the 2022 deadline for meeting pollution norms by two years.

Background

- In 2015, the Ministry of Environment, Forest and Climate Change (MoEF&CC) notified emission norms for particulate matter (PM), sulphur dioxide and oxides of nitrogen.
- Particulate matter is a mixture of solid particles and liquid droplets in the air. Some particles can be seen with the naked eye; others can only be detected under a microscope.
- PM can cause serious respiratory disorders and even damage the lungs.
- It set a 2017 deadline for thermal power plants to comply with emissions standards for installing Flue Gas Desulphurization (FGD) units that cut emissions of toxic sulphur dioxide.
- FGD is a set of technologies used to remove sulfur dioxide from exhaust flue gases of fossil-fuel power plants, and from the emissions of other sulfur dioxide emitting processes such as waste incineration.
- The deadline was later changed to varying deadlines for different regions, ending in 2022.
- More than 50% of the plants have not taken adequate steps to meet these emission norms.
- In February 2020, the Ministry of Power asked the Central Electricity Authority (CEA) to submit a paper to suggest periodicity of pollutant monitoring as well as

emission standards specific to plant locations.

- Accordingly, the CEA prepared a report, which was deemed incomplete and invalid by the Centre for Science and Environment (CSE).

Flue Gas Desulphurisation (FGD)

- Removal of Sulfur Dioxide is called as Flue-gas Desulphurization (FGD).
- It seeks to remove gaseous pollutants viz. SO₂ from exhaust flue gases generated in furnaces, boilers, and other industrial processes due to thermal processing, treatment, and combustion.

Sulfur Dioxide Pollution

▪ Source

- **The largest source of SO₂** : Burning of fossil fuels by power plants and other industrial facilities.
- **Smaller sources of SO₂** : Industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicles and heavy equipment that burn fuel with a high sulfur content.

▪ Impact

- Short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult.
- People with asthma, particularly children, are sensitive to these effects of SO₂.
- SO₂ emissions that lead to high concentrations of SO₂ in the air generally also lead to the formation of other sulfur oxides (SO_x). SO_x can react with other compounds in the atmosphere to form small particles.
- These particles contribute to particulate matter (PM) pollution.
