## What is measles?

November 12, 2022

In news— Mumbai has witnessed an outbreak of measles
recently.

## About measles-

- Measles or as it is called 'khasra', is a highly contagious viral disease which affects mostly children.
- It is one of the leading causes of death and disability among young children.
- There is no specific treatment for measles but there is a vaccine to stay protected from the disease, which is both safe as well as cost effective.
- Measles spreads by coughing and sneezing, close personal contact or direct contact with infected nasal or throat secretions.
- Death due to measles are caused by the complications associated with the disease like blindness, encephalitis, severe diarrhoea and pneumonia.
- The condition of an infected child turns severe in cases of poor nourishment, Vitamin A deficiency and if the child is immunocompromised.
- Symptoms appear around 10 to 14 days after exposure to the virus. The main symptoms are fever, dry cough, running nose, sore throat and rash.
- The rashes look like small red spots which remain slightly raised and give the skin a splotchy red appearance. The face of the rash breaks out first. Within days, it spreads to the rest of the body.
- The WHO recommends immunization for all children with two doses of measles vaccine, either alone, or in a measles-rubella (MR) or measles-mumps-rubella (MMR) combination.
- As per the guidance of National Health Mission, in India, measles vaccination is given under the Universal

Immunisation Programme at 9-12 months of age and the second dose at 16-24 months of age.
